is2GraphObject Namespace

[Missing <summary> documentation for "N:is2GraphObject"]

| - 010000 | 30 | |
|-------------|----------------------|---|
| | Class | Description |
| 4; | ArcException | Representa una exception de tipo Arc Error. |
| | ArcType | Representa un tipo Arco que puede ser definido de 7 formas. [1]: [Start, Any, End] [2]: [Start, Center, End] [3]: [Start, Center, Angle] [4]: [Start, Center, Length] [5]: [Start, End, Angle] [6]: [Start, End, Direction] [7]: [Start, End, Radius] Nota: Por convención el arco siempre queda definido en sentido antihorario. |
| 4 3 | CilindricalPointType | |
| 93 | CircleException | Representa una exception para el tipo Circle Error. |
| 9 \$ | CircleType | Representa un tipo Circunferencia. |
| eş. | ElipseType | Representa un tipo Elipse. |
| 93 | FilletException | Representa una exception para el |

| | | tipo Fillet Error. |
|-----------------|-------------------|---|
| 4 \$ | is2GraphObj | Biblioteca gráfica de entidades 2D. |
| % ; | LineType | Representa un tipo Línea. Esta línea se define por un punto y un ángulo, dando como resultado una línea que pasa por el punto 'P', forma un angulo con el eje de las abcisas determinado por 'Angle' y tiene longitud infinita. |
| 4 \$ | PlaneType | Representa un tipo Plano. |
| 9 3 | PointType | Representa un tipo Punto que puede ser definido tanto en el plano como el espacio. |
| P\$ | PolarPointType | Representa un tipo Punto Polar el cual es definido mediante coordenadas polares. |
| 9\$ | PolygonException | Representa una exception de tipo Polygon Error. |
| 4 \$ | PolygonType | Representa un tipo Polígono regular convexo. |
| 4 \$ | PolylineElement | Clase fachada que representa el elemento de una polilínea. |
| ? \$ | PolylineException | Representa una exception para el tipo Polyline Error. |
| ₽ \$ | PolylineType | Representa un tipo Polilínea. |
| 4 \$ | RectangleType | Representa un tipo Rectángulo. |
| 4 \$ | SegmentType | Representa un tipo Segmento. Un |

| | | segmento se define por dos puntos. |
|-----------------|--------------------|------------------------------------|
| ₽ \$ | SphericalPointType | |
| % \$ | TriangleType | Representa un tipo Triángulo. |

▲ Structures

| | Structure | Description |
|-----------|--------------------|--|
| % | ArcAnyPoint | Representa un punto cualquiera (ANY_POINT) de un Arco. |
| % | ArcCenterPoint | Representa el punto del centro (CENTER_POINT) de un Arco. |
| * | ArcDistance | Representa la distancia o longitud de la cuerda de un Arco. |
| % | ArcEndPoint | Representa el punto final (END_POINT) de un Arco. |
| % | ArcGradeAngle | Representa el ángulo en grados de un Arco. |
| \$ | ArcRadius | Representa el radio de un Arco. |
| % | ArcStartPoint | Representa el punto de inicio (START_POINT) de un Arco. |
| % | ArcVectorDirection | Representa la dirección de un arco. Esta dirección esta dada por un punto en el plano. |
| \$ | ChamferAngle | |
| \$ | ChamferDistante | |
| | | |

▲ Enumerations

| | |
|-----------------------|--|
| Enumeration | Description |
| ArcType ArcDirection | Define los tipos de Orientación que puede describir un arco. |
| CircleCircleRelation | Describe los tipos de relaciones relativas que ocurren entre dos circunferencias. |
| CircleSegmentRelation | Describe los tipos de relaciones que ocurren entre una circunferencia y en segmento de recta. |
| CircleType Type | Define la posicion relativa que ocupa la circunferencia con respecto aun polígono. |
| Cuadrante | Define cada una de las cuatro porciones en la que descompone un sistema de 2 planos interceptados en el espacio (Frontal, Horizontal). |
| Octante | Define cada una de las ochos porciones en la que descompone un sistema de 3 planos interceptados en el espacio (Frontal, Horizontal, Lateral). |
| Plane | Define los 3 planos que se forman por la intersección de los ejes de coordendas X-Y, Y- Z y X-Z. |

| | PointLinePosition |
|------------|-------------------------------------|
| 1 | PolylineElementType |
| 3 3 | TriangleType TriangleTypeByAngle |
| | TriangleType TriangleTypeBySide |

ArcAnyPoint Structure

Representa un punto cualquiera (ANY_POINT) de un Arco.

Namespace: is2GraphObject

Assembly: is2GraphObj_net4.5 (in is2GraphObj_net4.5.dll) Version:

1.0.0.0 (1.0.0.0) **Syntax**

C# public struct ArcAnyPoint

The ArcAnyPoint type exposes the following members.

■ Constructors

| | Name | Description |
|----------|-------------------------------------|-------------|
| ≟ | ArcAnyPoint(PointType) | |
| ≟ | ArcAnyPoint(Double, Double) | |
| = | ArcAnyPoint(Double, Double, Double) | |

Top

Methods

| | Name | Description |
|-----------|-------------|---|
| ≅© | Equals | Indicates whether this instance and a specified object are equal. (Inherited from ValueType.) |
| ≟ | GetHashCode | Returns the hash code for this instance. (Inherited from ValueType.) |
| ≡© | GetType | Gets the Type of the current instance. (Inherited from Object.) |
| ≟ | ToString | Returns the fully qualified type name of this instance. (Inherited from ValueType.) |

ArcType Class

Representa un tipo Arco que puede ser definido de 7 formas.

[1]: [Start, Any, End]

[2]: [Start, Center, End]

[3]: [Start, Center, Angle]

[4]: [Start, Center, Length]

[5]: [Start, End, Angle]

[6]: [Start, End, Direction]

[7]: [Start, End, Radius]

Nota: Por convención el arco siempre queda definido en sentido antihorario.

■ Inheritance Hierarchy System Object is2GraphObject ArcType

Namespace: is2GraphObject

Assembly: is2GraphObj_net4.5 (in is2GraphObj_net4.5.dll) Version:

C# public class ArcType

The ArcType type exposes the following members.

▲ Constructors

| | Name | Description |
|------------|---|--|
| ≡ | ArcType | Constructor por defecto. |
| ≡ | ArcType(ArcStartPoint, ArcAnyPoint, ArcEndPoint) | [1]: Crea un Arco usando 3 puntos [Start, Any, End]. |
| ≡ ♠ | ArcType(ArcType, ArcEndPoint, Boolean) | [9]: Crea un Arco continuo dado un arco y un punto [Arc_continue, End]. |
| ≡ ₩ | ArcType(SegmentType, ArcEndPoint, Boolean) | [8]: Crea un Arco continuo dado una recta y un punto [Line_continue, End]. |
| ≡ | ArcType(ArcStartPoint, ArcCenterPoint, ArcDistance, Boolean) | [4]: Crea un Arco usando 2 puntos y una longitud [Start, Center, Length]. |
| ∄ | ArcType(ArcStartPoint, ArcCenterPoint, ArcEndPoint, Boolean) | [2]: Crea un Arco usando 3 puntos [Start, Center, End]. |
| ≡ | ArcType(ArcStartPoint, ArcCenterPoint, ArcGradeAngle, Boolean) | [3]: Crea un Arco usando 2 puntos y un ángulo [Start, Center, Angle]. |
| ≓ | ArcType(ArcStartPoint, | Variante 5: Crea un Arco |

| | ArcEndPoint, ArcGradeAngle, Boolean) | usando 2 puntos y un ángulo [Start, End, angle]. |
|----|---|--|
| ΞΦ | ArcType(ArcStartPoint, ArcEndPoint, ArcRadius, Boolean) | [7]: Crea un Arco usando 2 puntos y radio [Start, End, Radius] |
| ΞΦ | ArcType(ArcStartPoint, ArcEndPoint, ArcVectorDirection, Boolean) | [6]: Crea un Arco usando 2 puntos y una dirección [Start, End, Direction]. |

Тор

■ Methods

| | Name | Description |
|--------------|--------------------|---|
| ∃ | Equals | Determines whether the specified object is equal to the current object. (Inherited from Object.) |
| ğ © | Finalize | Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.) |
| ≟ ∳ | GetArc3Points | Devuelve por referencia los puntos [Start], [Mid] y [End] del Arco. |
| =\$ S | GetArcDirection_2P | Duevuelve la orientacion del arco en {HORARIO / ANTIHORARIO} según sus puntos Start y End. |

| ≘ù S | GetArcDirection_3P | Duevuelve la orientacion del arco en {HORARIO / ANTIHORARIO} analizado la disposicion de 3 de sus puntos (start, any y end). |
|--------------|------------------------|--|
| =\$ S | GetArcDirectionByAngle | Duevuelve la orientacion del arco en {HORARIO / ANTIHORARIO} según el ángulo de inicio, ángulo final y ángulo de barribo. |
| ΞΦ | GetHashCode | Serves as the default hash function. (Inherited from Object.) |
| ≓ ℚ | GetType | Gets the Type of the current instance. (Inherited from Object.) |
| ₹ | MemberwiseClone | Creates a shallow copy of the current Object. (Inherited from Object.) |
| ∃ | ToString | Returns a string that represents the current object. (Inherited from Object.) |

Тор

▲ Properties

| · | Name | Description |
|---|----------|--------------------------------------|
| | Angle | Representa el angulo del arco. |
| | Center | Representa el punto centro del arco. |
| | EndAngle | Representa el ángulo final del arco. |

| EndPoint | Representa el punto final del arco. |
|------------|---|
| Longitude | Propiedad de solo lectura. Devuelve la longitud del arco. |
| MidPoint | Representa el punto medio del arco. |
| Radius | Representa el radio del arco. |
| StartAngle | Representa el ángulo de inicio del arco. |
| StartPoint | Representa el punto de inicio del arco. |

```
public void GetArc3Points(
    out PointType Pi,
    out PointType Pm,
    out PointType Pf
)
```

Pi

Type: is2GraphObject PointType

Parámetro de salida (out). Retorna por referencia el punto de inicio del arco.

Pm

Type: is2GraphObject PointType

Parámetro de salida (out). Retorna por referencia punto medio del arco.

Pf

Type: is2GraphObject PointType

Parámetro de salida (out). Retorna por referencia el punto final del arco.

CircleException Class is2GraphObject Namespace

CircleSegmentRelation Enumeration

Describe los tipos de relaciones que ocurren entre una circunferencia y en segmento de recta.

Namespace: is2GraphObject

Assembly: is2GraphObj_net4.5 (in is2GraphObj_net4.5.dll) Version:

C# public enum CircleSegmentRelation

Members

| Member name | Value | Description |
|----------------|-------|---|
| Exterior | 0 | Indica que el segmento es exterior a la circunferencia. |
| Tangent | 1 | Indica que el segmento es tangente a la circunferencia. |
| Secant | 2 | Indica que el segmento es Secante a la circunferencia. |
| SimpleAcross | 3 | Indica que el segmento intercepta a la circunferencia en un solo punto pero sin ser tangente. |

Namespace: is2GraphObject

Assembly: is2GraphObj_net4.5 (in is2GraphObj_net4.5.dll) Version:

C# public class CircleType

The CircleType type exposes the following members.

▲ Constructors

| | Name | Description |
|-----------|--|--|
| =0 | CircleType | Constructor por defecto. |
| ∃∳ | CircleType(PointType, PointType) | Constructor que toma como parámetros 2 puntos que pertenecen a la mayor cuerda (diámetro) de una circunferecia. |
| Ξ₩ | CircleType(PointType, Double) | Constructor que toma como parámetros el punto centro y el radio de la circunferencia. |
| Ξ | CircleType(SegmentType, SegmentType, SegmentType) | Constructor que toma como parámetros 3 segmentos y crea una circunferencia que es tangente al mismo tiempo a los 3 segmentos. |
| ∃ 🍑 | CircleType(PointType, PointType, PointType, CircleType Type) | Constructor que toma como parámetros 3 puntos, y crea una circunferencia que pasa por estos 3 puntos si el valor del parámetro "t" es - Circunscripta Por el contrario el valor de "t" es - Inscripta- los puntos dados sirven como vértices para el |

| | | cálculo del incentro del triángulo imaginario que estos forman, con lo que se obtiene una circunferencia inscripta. |
|-----------|--|---|
| ≡© | CircleType(SegmentType, SegmentType, Double, Boolean, Boolean) | Constructor que toma como parámetros 2 segmentos y un valor de radio, y XXX |

Тор

■ Methods

| | Name | Description | |
|----------|-----------------|---|--|
| = | Equals | Determines whether the specified object is equal to the current object. (Inherited from Object.) | |
| ē û | Finalize | Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.) | |
| ≟ | GetHashCode | Serves as the default hash function. (Inherited from Object.) | |
| ≡ | GetType | Gets the Type of the current instance. (Inherited from Object.) | |
| Ģ ♥ | MemberwiseClone | Creates a shallow copy of the current Object. (Inherited from Object.) | |
| ≘ | ToString | Returns a string that represents the current object. | |

(Inherited from Object.)

CircleType Class CircleType Overload is2GraphObject Namespace

CircleType Constructor (PointType, PointType, PointType, PointType)

Constructor que toma como parámetros 3 puntos, y crea una circunferencia que pasa por estos 3 puntos si el valor del parámetro "t" es -Circunscripta-. Por el contrario el valor de "t" es -Inscripta- los puntos dados sirven como vértices para el cálculo del incentro del triángulo imaginario que estos forman, con lo que se obtiene una circunferencia inscripta.

Namespace: is2GraphObject

Assembly: is2GraphObj net4.5 (in is2GraphObj net4.5.dll) Version:

```
C#
public CircleType(
          PointType P1,
          PointType P2,
          PointType P3,
          CircleType Type t = CircleType Type.CircleType Ty
```

Parameters

P1

Type: is2GraphObject PointType

Primer punto.

P2

Type: is2GraphObject PointType

Segundo punto.

P3

Type: is2GraphObject PointType

Tercer punto.

t (Optional)

Type: is2GraphObject CircleType Type

Indica de que forma respecto a P1, P2, P3 se crea la circunferencia. La cuál puede ser "inscripta" al triangulo imaginario que forman estos 3 puntos o "circunscripta" a este.

CircleType Constructor (SegmentType, SegmentType, Double, Boolean, Boolean)

Constructor que toma como parámetros 2 segmentos y un valor de radio, y XXX

Namespace: is2GraphObject

Assembly: is2GraphObj net4.5 (in is2GraphObj net4.5.dll) Version:

```
public CircleType(
    SegmentType S1,
    SegmentType S2,
    double radius,
    bool s1_right_up = true,
    bool s2_right_up = true
)
```

Parameters

S1

Type: is2GraphObject SegmentType

Primer segmento.

S2

Type: is2GraphObject SegmentType

Segundo segmento.

radius

Type: System Double

Equidistancia a ambos segmentos.

Nota: El valor del radio se considera siempre positivo, por lo que establecer un valor de radio negativo no tiene ninguna influencia.

s1_right_up (Optional)
Type: System Boolean

Determina hacia que lado del segmento "S1" se calcula el circle.

Nota: Si el valor es **true**, el circle se calcula hacia la derecha-oarriba del segmento. Por el contrario si el valor es **false**, el circle se calcula hacia la izquierda-o-abajo del segmento. En ambos casos su aplicación es sobre el segmento "S1".

s2_right_up (Optional)

Type: System Boolean

Determina hacia que lado del segmento "S2" se calcula el circle.

Nota: Si el valor es **true**, el circle se calcula hacia la derecha-oarriba del segmento. Por el contrario si el valor es **false**, el circle se calcula hacia la izquierda-o-abajo del segmento. En ambos casos su aplicación es sobre el segmento "S2".

FilletException Properties

The FilletException type exposes the following members.

▲ Properties

| 21 Toperties | | | | |
|--------------|----------------|--|--|--|
| | Name | Description | | |
| | Data | Gets a collection of key/value pairs that provide additional user-defined information about the exception. (Inherited from Exception.) | | |
| | HelpLink | Gets or sets a link to the help file associated with this exception. (Inherited from Exception.) | | |
| | HResult | Gets or sets HRESULT, a coded numerical value that is assigned to a specific exception. (Inherited from Exception.) | | |
| | InnerException | Gets the Exception instance that caused the current exception. (Inherited from Exception.) | | |
| | Message | Gets a message that describes the current exception. (Inherited from Exception.) | | |
| | Source | Gets or sets the name of the application or the object that causes the error. (Inherited from Exception.) | | |
| | StackTrace | Gets a string representation of the | | |

| | immediate frames on the call stack. (Inherited from Exception.) |
|------------|--|
| TargetSite | Gets the method that throws the current exception. (Inherited from Exception.) |

Methods

| | Name | Description |
|-------------|---|---|
| ≅∳ S | AngleInQuadrant | Determina el cuadrante en el que se ubica el valor de ángulo dado. Nota: el valor de ángulo esta expresado en grados. |
| □♠ S | ArcArcFillet(ArcType, ArcType, Double, Boolean, Boolean, Boolean) | Calcula el fillet (EMPALME) entre dos arcos de circunferencias "A1" y "A2" dados, con radio determinado por "r_fillet". |

| | ArcArcFillet(ArcType, ArcType, Double, PointType, PointType, PointType, Boolean, Boolean, Boolean) | Calcula el fillet (EMPALME) entre dos arcos de circunferencias "A1" y "A2" dados, con radio determinado por "r_fillet". |
|--------------|--|---|
| =\$ | ArcArcIntersect | Calcula el o los puntos de intercepcion entre dos arcos de circunferencias. |
| =\$ | ArcCircleIntersect | Calcula el o los puntos de intercepcion entre una circunferencia y un arco de circunferencia. |
| ≑ û S | ArcLineIntersect | Calcula el o los puntos de intercepcion entre una línea y un arco de circunferencia. |
| =\$ | ArcSegmentFillet(ArcType, SegmentType, Double, Boolean, Boolean, Boolean) | Calcula el fillet (EMPALME) entre un arco de circunferencia "A" y un |

| | | segmento de recta "S" dados, con radio determinado por "r_fillet". |
|--------------|---|---|
| ■Û S | ArcSegmentFillet(ArcType, SegmentType, Double, PointType, PointType, Boolean, Boolean, Boolean) | Calcula el fillet (EMPALME) entre un arco de circunferencia "A" y un segmento de recta "S" dados, con radio determinado por "r_fillet". |
| ∃ ŵ S | ArcSegmentIntersect | Calcula el o los puntos de intercepcion entre un arco de circunferencia y un segmento de recta. |
| ≅ © S | CanonicElipseCoefficient | Determina los coeficientes de la ecuación canónica de la elipse (Ax^2 + By^2 + E = 0) para la elipse 'Elip' dada. |
| ≅ ≬ S | CartesianToPolar | Convierte |

| | | coordenadas Cartesianas a coordenadas Polares. |
|-------------|--|---|
| ≅♦ S | CheckPointLineRelativePosition | Determina si la posición relativa que tiene un punto "P" respecto a recta "L" cumple con la condición indicada por "condition". |
| ≡© S | CilindricalPoint | Ubica un punto mediante coordenadas cilíndricas. |
| =\$ | CircleCircleFillet(CircleType, CircleType, Double, Boolean, Boolean, Boolean) | Calcula el fillet (EMPALME) entre dos circunferencias "C1" y "C2" dados, con radio determinado por "r_fillet". |
| ≡© S | CircleCircleFillet(CircleType, CircleType, Double, PointType, PointType, PointType, Boolean, Boolean, Boolean) | Calcula el fillet (EMPALME) entre dos circunferencias "C1" y "C2" dados, con radio determinado |

| | | | por "r_fillet". |
|--|--------------|---|---|
| | ≅ ŷ S | CircleCircleIntersect | Calcula el o los puntos de intercepción entre dos circunferencias. |
| | ≅ ŷ S | CircleCircleRelationShip | Determina la relacion que hay entre 2 circunfencias. |
| | ≅ ŷ S | CircleCoefficient | Determina los coeficientes de la ecuación general de la circunferencia (x^2 + y^2 + Ax + By + C = 0) para la circunferencia 'Cir' dada. |
| | ∉ Q S | CircleElipseIntersect | |
| | ĕ ŷ S | CircleLineIntersect | Calcula el o los puntos de intercepción entre una línea y un circunferencia. |
| | ∃ ŷ S | CircleSegmentFillet(CircleType, SegmentType, Double, Boolean, Boolean, Boolean) | Calcula el fillet (EMPALME) entre una circunferencia "C" y un segmento de |

| | | recta "S" dados, con radio determinado por "r_fillet". |
|--------------|---|--|
| ∃ ù S | CircleSegmentFillet(CircleType, SegmentType, Double, PointType, PointType, Boolean, Boolean, Boolean) | Calcula el fillet (EMPALME) entre una circunferencia "C" y un segmento de recta "S" dados, con radio determinado por "r_fillet". |
| ≡ û S | CircleSegmentIntersect | Calcula el o los puntos de intercepcion entre una circunferencia y un segmento de recta. |
| ≡ ù S | CircleSegmentRelationShip | Determina la relación que hay entre una circunfencias y un segmento. |
| ã ŷ S | CircleTangentToLine | Determina la circunferencia que tiene su centro en "P" y para la cual la línea "L" dada es tangente. |

| ≅ © S | ComplementaryAngle | Determina dado un angulo, el valor del angulo complementario |
|--------------|---------------------|--|
| =\$ | ElipseCoefficient | Determina los coeficientes de la ecuación general de la elipse (Ax^2 + By^2 + Cx + Dy + E = 0) para la elipse 'Elip' dada. |
| =0 S | ElipseLineIntersect | |
| ⊒₩ | Equals | Determines whether the specified object is equal to the current object. (Inherited from Object.) |
| ≅∳ S | FarInXAxis | Determina cuál de los puntos "P1" y "P2" dados esta más alejado de "pbase" sobre el eje de las abcisas (Eje X). |
| =∅ S | FarInYAxis | Determina cuál de los puntos "P1" y "P2" dados esta más alejado de |

| | | "pbase" sobre el eje de las ordenadas (Eje Y). |
|-------------|---|---|
| =♦ S | FarToOrigen | Determina cuál de los puntos "P1" y "P2" dados está más lejano del origen de coordenadas [0; 0]. |
| =♦ S | FarToPoint(PointType, List PointType) | Determina de una lista de puntos definidas por "list" el punto más alejado del punto base "pbase". |
| =\$ | FarToPoint(PointType, PointType, PointType) | Determina cuál de los dos puntos dados "P1" y "P2" está más alejado al punto "pbase". |
| ĕ | Finalize | Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage |

| | | collection. (Inherited from Object.) |
|--------------|-------------------|--|
| ∃ | GetHashCode | Serves as the default hash function. (Inherited from Object.) |
| ∃ | GetType | Gets the Type of the current instance. (Inherited from Object.) |
| ≘ ≬ S | GradToRad | Convierte de Grados a Radianes. |
| =\$ | isColinearSegment | Determina si dos segmetos "S1" y "S2" dados son colineales. |
| ₫Q S | isEqualArc | Comprueba si dos arcos dados "A1" y "A2" son iguales. |
| ≅ ∅ S | isEqualCero | Determina si el parámetro 'value' se considera un cero real. |
| ĕ ≬ S | isEqualCircle | Comprueba si |

| | | dos circunferencias dadas "C1" y "C2" son iguales. |
|-------------|---------------------|---|
| ∄ \$ | isEqualPoint | Comprueba si dos puntos dados "P1" y "P2" son iguales. |
| =\$ | isEqualSegment | Comprueba si dos Segmentos dado "S1" y "S2" son iguales. |
| ₫\$ | isEqualValues | Determina si los dos valor pasados por parámetro son iguales. |
| ₫\$ | isNegative | Determina si el valor pasado por parámetro es negativo. |
| ≘↓ S | isPositive | Determina si el valor pasado por parámetro es positivo. |
| ∌ \$ | LineAccordingLineAt | Determmina una línea que pasa por el punto "P" y que forma con la |

| | | línea "L" dada, un ángulo determinado por el parámetro "angle". |
|--------------|--|---|
| ₫\$ | LineCoefficient(LineType, Double , Double , Double) | Determina los coeficientes de la ecuacion general de la recta (Ax + By + C = 0) para la recta 'L' dada. |
| ₫♠ S | LineCoefficient(SegmentType, Double, Double, Double) | Determina los coeficientes de la ecuacion general de la recta (Ax + By + C = 0) para el segmento 'S' dado. |
| ã ù S | LineLineAngle | Determina el ángulo según su tipo (agudo u obtuso) que se forma entre dos líneas "L1" y "L2" dadas. |
| ∉ ŷ S | LineLineIntersect | Calcula el punto de intercepción entre dos líneas. |
| ë ù S | LineTangentToCircle | Determina las |

rectas tangentes a la circunferecia "C" dada y que pasan por el punto "P".

=0 S

MakeMPQx

Resuelve un sistema de ecuaciones de 2 con 2 por el método de sustitución, despejando 'X' en la ecuación lineal para luego sustituirla en la ecuación cuadrática. De lo que se obtiene un polinomio de la forma: $mx^2 +$ px + q.

Nota: Los parámetros A, B, C, A1, B1, C1 se interpretan de la siguiente forma: - A, B, C: coeficiente de una ecuación lineal de la forma Ax + By + C = 0 - A1, B1, C1:

coeficientes de una ecuación cuadrática X^2 + y^2 + A1x + B1y + C1 = 0

Resuelve un

[■] S MakeMPQy

sistema de ecuaciones de 2 con 2 por el método de sustitución, despejando 'Y' en la ecuación lineal para luego sustituirla en la ecuación cuadrática. De lo que se obtiene un polinomio de la forma: $mx^2 +$ px + q. Nota: Los parámetros A, B, C, A1, B1, C1 se interpretan de la siguiente forma: - A, B, C: coeficiente de una ecuación lineal de la forma Ax + By+ C = 0 - A1,B1, C1: coeficientes de una ecuación cuadrática X^2

| | | $+ y^2 + A1x + B1y + C1 = 0$ |
|--------------|-----------------|---|
| ∄ | MaxXSegment | Determina el mayor valor de la coordenada X que contiene el segmento 'S' dado. |
| =\$ S | MaxYSegment | Determina el mayor valor de la coordenada Y que contiene el segmento 'S' dado. |
| ∃ ≬ S | MayorEstricto | Determina si el primer parámetro es estrictamente mayor que el segundo. |
| € Q S | MayorOrEqual | Comprueba si el primer parámetro es mayor o igual que el segundo. |
| ₹ | MemberwiseClone | Creates a shallow copy of the current Object. (Inherited from Object.) |
| =♦ S | MenorEstricto | Determina si el primer |

| | | parámetro es estrictamente menor que el segundo. |
|--------------|----------------------|---|
| ∉∳ S | MenorOrEqual | Comprueba si el parámetro 'a' es menor o igual que 'b'. |
| =◊ S | MidPointBetweenPoint | Determina el punto medio o punto equidistante entre 2 puntos "P1" y "P2" dados. |
| =\$ S | MinXSegment | Determina el menor valor de la coordenada X que contiene el segmento 'S' dado. |
| =\$ | MinYSegment | Determina el menor valor de la coordenada Y que contiene el segmento 'S' dado. |
| = 0 S | NearInXAxis | Determina cuál de los puntos "P1" y "P2" dados esta más cercano a "pbase" sobre el eje de las |

| | | abcisas (Eje X). |
|--------------|--|--|
| ∄ © S | NearInYAxis | Determina cuál de los puntos "P1" y "P2" dados esta más cercano a "pbase" sobre el eje de las ordenadas (Eje Y). |
| ∄ Q S | NearToOrigen | Determina cuál de los puntos "P1" y "P2" dados está más cercano al origen de coordenadas [0; 0]. |
| ∉ ŷ S | NearToPoint(PointType, List PointType) | Determina que punto de una lista de puntos dada esta más cercano al punto "pbase". |
| ₫ \$ | NearToPoint(PointType, PointType, PointType) | Determina cuál de los puntos "P1" y "P2" dados está más cercano al punto "pbase". |
| ∉∳ S | NormalizeAngle | Normaliza un valor de ángulo. |
| ≡ ù S | OppositeAngle | Determina dado |

| | | un ángulo, el valor del ángulo opuesto en el sistema de ejes de coordenadas. |
|--------------|---------------------|---|
| ≟∳ S | ParallelLineAt | Determina una línea que es paralela a la línea "L" dada y que pasa por el punto "P". |
| ≓∲ S | PerperdicularLineAt | Determina una línea que es perpendicular a la línea "L" dada y que pasa por el punto "P". |
| ≅Q S | PointInArc | Determina si el punto "P" dado pertenece al arco "A". |
| ≘ © S | PointInCircle | Determina si el punto "P" dado pertenece al circunferencia "C". |
| ≘∳ S | PointInLine | Determina si el punto "P" dado pertenece la línea "L". |
| ≡ ≬ S | PointInOctant | Determina |

| | | sobre que octante se ubica el punto "P" dado. |
|--------------|--------------------|---|
| ∃ ∳ S | PointInQuadrant | Determina el cuadrante en el que se ubica el punto dado. |
| ∃ ∳ S | PointInSegment | Determina si el punto "P" dado pertenece al segmento "S". |
| ∃ ∳ S | PointLineDistance | Determina la distancia un punto "P" a una línea "L" dados. |
| =♦ S | PointPointAngle | Determina el valor del ángulo que se forma entre segmento que describen los puntos "P1" y "P2" dados y el eje de las abcisas (Eje X). |
| ₫\$ | PointPointDistance | Calcula la distancia entre los puntos "P1" y "P2" dados. |
| ∉\$ | PointPointSlope | Calcula la pendiente de la linea que pasa por los puntos |

| | | "P1" y "P2" dados. |
|--------------|------------------------|--|
| ₫\$ | PolarPoint | Ubica un punto 2D mediante coordenadas polares partir de un punto base, un ángulo y una distancia. |
| ∄ Q S | PolarToCartesian | Convierte coordenadas Polares a coordenadas Cartesianas. |
| ≡ ≬ S | PolygonLineIntersect | |
| =\$ S | RadToGrad | Convierte de Radianes a Grados. |
| =♦ S | RectangleLineIntersect | |
| ∃ ≬ S | RootMPQ | Calcula las raíces de polinomios de 2do orden que tienen la forma: mx^2 + px + q por el método del Descriminante. |
| ∄ \$ | RotateArc | Rota en el plano XY el arco 'A' sobre un punto |

| | | 'pbase' dado según un ángulo especificado. |
|---------------|---------------------------|---|
| ≅ ∅ S | RotateCircle | Rota en el plano XY el circulo 'C' sobre un punto 'pbase' dado según un ángulo especificado. |
| ≅∅ S | RotatePoint | Rota en el plano XY el punto 'P' sobre un punto 'pbase' dado según un ángulo especificado. |
| =\$ | RotateSegment | Rota en el plano XY el segmento 'S' sobre un punto 'pbase' dado según un ángulo especificado. |
| ≅ ŷ \$ | SegmentsApparentIntersect | Determina la intercepción aparente en el plano entre dos segmentos. Nota: La intersección |

| | | aparente indica |
|--------------|---|--|
| ≅ ŷ S | SegmentSegmentAngle | Determina el ángulo según su tipo (agudo u obtuso) que se forma entre dos segmentos "S1" y "S2" dadas. |
| ≅ ŷ S | SegmentSegmentChamfer(SegmentType, SegmentType, ChamferDistante, ChamferAngle, PointType, PointType) | |
| ≅ ŷ S | SegmentSegmentChamfer(SegmentType, SegmentType, ChamferDistante, ChamferDistante, PointType, PointType) | |
| ≅© S | SegmentSegmentFillet(SegmentType, SegmentType, Double, Boolean, Boolean) | Calcula el fillet (EMPALME) entre dos segmentos de rectas "S1" y "S2" dados, con radio determinado por "r_fillet". |
| ∃ © S | SegmentSegmentFillet(SegmentType, SegmentType, Double, PointType, PointType, Boolean, Boolean) | Calcula el fillet (EMPALME) entre dos segmentos de rectas "S1" y "S2" dados, con radio determinado por "r_fillet". |

SegmentSegmentFilletSave

| ≅ŵ S | SegmentsRealIntersect | Determina la intercepción real en el plano entre dos segmentos. Nota: La intersección real indica que ambos segmentos tienen realmente un punto en común. |
|--------------|-----------------------|--|
| ≅ŵ S | SetPresicion | Establece la precision (posiciones decimales) que tiene en cuenta is2Graph para comprobar el valor del Cero Real. |
| ∃ ∲ S | SphericalPoint | Ubica un punto 3D mediante coordenadas esféricas. |
| =© S | SwapArc | Intercambia los dos arcos pasados por parámetro. |
| ₫\$ | SwapCircle | Intercambia las dos |

| | | circunferencias pasados por parámetro. |
|---------------------|-----------------|---|
| =\$ S | SwapLine | Intercambia las dos líneas pasados por parámetro. |
| =\$ S | SwapPoint | Intercambia los dos puntos pasados por parámetro. |
| : ∳ S | SwapSegment | Intercambia los dos segmentos pasados por parámetro. |
| ∃ ∲ S | SwapValue | Intercambia los dos valores pasados por parámetro. |
| ∄ | ToString | Returns a string that represents the current object. (Inherited from Object.) |
| =♦ S | TranslateArc | Traslada el arco 'A' las distancias definas por las componentes dx, dy, dz. |
| ≅ ¢ S | TranslateCircle | Traslada el |

| | | circulo 'C' las distancias definas por las componentes dx, dy, dz. |
|--------------|------------------|--|
| =\$ | TranslatePoint | Traslada el punto 'P' las distancias definas por las componentes dx, dy, dz. |
| ≅ ŷ S | TranslateSegment | Traslada el segmento 'S' las distancias definas por las componentes dx, dy, dz. |

▲ Remarks is2GraphObj es la versión Orientada a Objetos de su antecesora is2Graph, re-escrita completamente para la tecnologia .Net de Microsoft. Representa la evolución de la libreria gráfica escrita por DrC. Ricardo Ávila Rondón llamada is2Graph (implementada inicialmente en c++ la cuál no tenia soporte para la orientacion a objetos). Is2GraphObj corrige un grupo de bugs que existían en su antecesora, asi mismo agrega nuevas entidades geometricas, muchas más características y más funcionalidades.

is2GraphObj Methods

The is2GraphObj type exposes the following members.

Methods

| | Name | Description |
|-------------|--|---|
| -♦ 5 | AngleInQuadrant | Determina el cuadrante en el que se ubica el valor de ángulo dado. Nota: el valor de ángulo esta expresado en grados. |
| a S S | ArcArcFillet(ArcType, ArcType, Double, Boolean, Boolean, Boolean) | Calcula el fillet (EMPALME) entre dos arcos de circunferencias "A1" y "A2" dados, con radio determinado por "r_fillet". |
| eŵ S | ArcArcFillet(ArcType, ArcType, Double, PointType, PointType, PointType, Boolean, Boolean, Boolean) | Calcula el fillet (EMPALME) entre dos arcos de circunferencias "A1" y "A2" dados, con radio |

| | | determinado por "r_fillet". |
|--------------|---|---|
| =\$ | ArcArcIntersect | Calcula el o los puntos de intercepcion entre dos arcos de circunferencias. |
| =\$ S | ArcCircleIntersect | Calcula el o los puntos de intercepcion entre una circunferencia y un arco de circunferencia. |
| ≘∳ S | ArcLineIntersect | Calcula el o los puntos de intercepcion entre una línea y un arco de circunferencia. |
| =♦ S | ArcSegmentFillet(ArcType, SegmentType, Double, Boolean, Boolean, Boolean) | Calcula el fillet (EMPALME) entre un arco de circunferencia "A" y un segmento de recta "S" dados, con radio determinado por "r_fillet". |
| =♦ S | ArcSegmentFillet(ArcType, SegmentType, | Calcula el fillet |

| | Double, PointType, PointType, PointType, Boolean, Boolean, Boolean) | (EMPALME) entre un arco de circunferencia "A" y un segmento de recta "S" dados, con radio determinado por "r_fillet". |
|--------------|---|---|
| ≡\$ | ArcSegmentIntersect | Calcula el o los puntos de intercepcion entre un arco de circunferencia y un segmento de recta. |
| ≡\$ | CanonicElipseCoefficient | Determina los coeficientes de la ecuación canónica de la elipse (Ax^2 + By^2 + E = 0) para la elipse 'Elip' dada. |
| ≘∳ S | CartesianToPolar | Convierte coordenadas Cartesianas a coordenadas Polares. |
| ∉ © S | CheckPointLineRelativePosition | Determina si la posición relativa que |

| | | tiene un punto "P" respecto a recta "L" cumple con la condición indicada por "condition". |
|--------------|---|--|
| =\$ S | CilindricalPoint | Ubica un punto mediante coordenadas cilíndricas. |
| =♦ S | CircleCircleFillet(CircleType, CircleType, Double, Boolean, Boolean, Boolean) | Calcula el fillet (EMPALME) entre dos circunferencias "C1" y "C2" dados, con radio determinado por "r_fillet". |
| =♠ S | CircleCircleFillet(CircleType, CircleType, Double, PointType, PointType, Boolean, Boolean, Boolean) | Calcula el fillet (EMPALME) entre dos circunferencias "C1" y "C2" dados, con radio determinado por "r_fillet". |
| ≅∳ S | CircleCircleIntersect | Calcula el o los puntos de intercepción entre dos circunferencias. |

| | CircleCircleRelationShip | Determina la relacion que hay entre 2 circunfencias. |
|--------------|---|---|
| ≅∲ S | CircleCoefficient | Determina los coeficientes de la ecuación general de la circunferencia (x^2 + y^2 + Ax + By + C = 0) para la circunferencia 'Cir' dada. |
| =\$ S | CircleElipseIntersect | |
| =\$ | CircleLineIntersect | Calcula el o los puntos de intercepción entre una línea y un circunferencia. |
| =\$ S | CircleSegmentFillet(CircleType, SegmentType, Double, Boolean, Boolean, Boolean) | Calcula el fillet (EMPALME) entre una circunferencia "C" y un segmento de recta "S" dados, con radio determinado por "r_fillet". |
| ≅ ∅ S | CircleSegmentFillet(CircleType, SegmentType, Double, PointType, | Calcula el fillet (EMPALME) |

| | PointType , PointType , Boolean, Boolean, Boolean) | entre una circunferencia "C" y un segmento de recta "S" dados, con radio determinado por "r_fillet". |
|--------------|--|--|
| ≡\$ S | CircleSegmentIntersect | Calcula el o los puntos de intercepcion entre una circunferencia y un segmento de recta. |
| ≡\$ S | CircleSegmentRelationShip | Determina la relación que hay entre una circunfencias y un segmento. |
| ≡\$ S | CircleTangentToLine | Determina la circunferencia que tiene su centro en "P" y para la cual la línea "L" dada es tangente. |
| ∄ \$ | ComplementaryAngle | Determina dado un angulo, el valor del angulo complementario |
| ∉\$ | ElipseCoefficient | Determina los coeficientes de |

| | | la ecuación general de la elipse (Ax^2 + By^2 + Cx + Dy + E = 0) para la elipse 'Elip' dada. |
|--------------|---------------------|---|
| =◊ S | ElipseLineIntersect | |
| ∃ | Equals | Determines whether the specified object is equal to the current object. (Inherited from Object.) |
| =↓ S | FarInXAxis | Determina cuál de los puntos "P1" y "P2" dados esta más alejado de "pbase" sobre el eje de las abcisas (Eje X). |
| ≡∅ S | FarInYAxis | Determina cuál de los puntos "P1" y "P2" dados esta más alejado de "pbase" sobre el eje de las ordenadas (Eje Y). |
| = ◊ S | FarToOrigen | Determina cuál de los puntos |

| | | "P1" y "P2" dados está más lejano del origen de coordenadas [0; 0]. |
|--------------|---|---|
| ₫\$ | FarToPoint(PointType, List PointType) | Determina de una lista de puntos definidas por "list" el punto más alejado del punto base "pbase". |
| ≅ ù S | FarToPoint(PointType, PointType, PointType) | Determina cuál de los dos puntos dados "P1" y "P2" está más alejado al punto "pbase". |
| • | Finalize | Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.) |
| ≘∳ | GetHashCode | Serves as the default hash function. |

| | | (Inherited from Object.) |
|--------------|-------------------|--|
| ∃ © | GetType | Gets the Type of the current instance. (Inherited from Object.) |
| ≅ © S | GradToRad | Convierte de Grados a Radianes. |
| =\$ S | isColinearSegment | Determina si dos segmetos "S1" y "S2" dados son colineales. |
| =\$ S | isEqualArc | Comprueba si dos arcos dados "A1" y "A2" son iguales. |
| ≡ © S | isEqualCero | Determina si el parámetro 'value' se considera un cero real. |
| ≅∳ S | isEqualCircle | Comprueba si dos circunferencias dadas "C1" y "C2" son iguales. |
| ∉Q S | isEqualPoint | Comprueba si |

| | | dos puntos dados "P1" y "P2" son iguales. |
|--------------|---------------------|---|
| ∉\$ | isEqualSegment | Comprueba si dos Segmentos dado "S1" y "S2" son iguales. |
| =\$ S | isEqualValues | Determina si los dos valor pasados por parámetro son iguales. |
| ∉∳ S | isNegative | Determina si el valor pasado por parámetro es negativo. |
| ∉∳ S | isPositive | Determina si el valor pasado por parámetro es positivo. |
| ≡ ŷ S | LineAccordingLineAt | Determmina una línea que pasa por el punto "P" y que forma con la línea "L" dada, un ángulo determinado por el parámetro "angle". |

| | LineCoefficient(LineType, Double, Double, Double) | Determina los coeficientes de la ecuacion general de la recta (Ax + By + C = 0) para la recta 'L' dada. |
|-------------|--|---|
| =↓ S | LineCoefficient(SegmentType, Double, Double, Double) | Determina los coeficientes de la ecuacion general de la recta (Ax + By + C = 0) para el segmento 'S' dado. |
| ≡∅ S | LineLineAngle | Determina el ángulo según su tipo (agudo u obtuso) que se forma entre dos líneas "L1" y "L2" dadas. |
| ∄ \$ | LineLineIntersect | Calcula el punto de intercepción entre dos líneas. |
| =♦ S | LineTangentToCircle | Determina las rectas tangentes a la circunferecia "C" dada y que pasan por el punto "P". |
| =♦ S | | |

MakeMPQx

Resuelve un sistema de ecuaciones de 2 con 2 por el método de sustitución, despejando 'X' en la ecuación lineal para luego sustituirla en la ecuación cuadrática. De lo que se obtiene un polinomio de la forma: $mx^2 +$ px + q.

Nota: Los parámetros A, B, C, A1, B1, C1 se interpretan de la siguiente forma: - A, B, C: coeficiente de una ecuación lineal de la forma Ax + By+ C = 0 - A1,B1, C1: coeficientes de una ecuación cuadrática X^2 $+ y^2 + A1x +$ B1y + C1 = 0

sistema de ecuaciones de 2 con 2 por el método de sustitución, despejando 'Y' en la ecuación lineal para luego sustituirla en la ecuación cuadrática. De lo que se obtiene un polinomio de la forma: $mx^2 +$ px + q. Nota: Los parámetros A, B, C, A1, B1, C1 se interpretan de la siguiente forma: - A, B, C: coeficiente de una ecuación lineal de la forma Ax + By+ C = 0 - A1,B1, C1: coeficientes de una ecuación cuadrática X^2 $+ y^2 + A1x +$ B1y + C1 = 0

≘∳ **S**

MaxXSegment

Determina el mayor valor de la coordenada X que contiene

| | | el segmento 'S' dado. |
|--------------|-----------------|---|
| =\$ | MaxYSegment | Determina el mayor valor de la coordenada Y que contiene el segmento 'S' dado. |
| =\$ S | MayorEstricto | Determina si el primer parámetro es estrictamente mayor que el segundo. |
| =\$ S | MayorOrEqual | Comprueba si el primer parámetro es mayor o igual que el segundo. |
| Ģ ♥ | MemberwiseClone | Creates a shallow copy of the current Object. (Inherited from Object.) |
| =\$ S | MenorEstricto | Determina si el primer parámetro es estrictamente menor que el segundo. |
| ∃ ∅ S | MenorOrEqual | Comprueba si el parámetro 'a' |

| | | es menor o igual que 'b'. |
|--------------|----------------------|---|
| =\$ S | MidPointBetweenPoint | Determina el punto medio o punto equidistante entre 2 puntos "P1" y "P2" dados. |
| ≅© S | MinXSegment | Determina el menor valor de la coordenada X que contiene el segmento 'S' dado. |
| =\$ S | MinYSegment | Determina el menor valor de la coordenada Y que contiene el segmento 'S' dado. |
| ∌ S | NearInXAxis | Determina cuál de los puntos "P1" y "P2" dados esta más cercano a "pbase" sobre el eje de las abcisas (Eje X). |
| ∌ \$ | NearInYAxis | Determina cuál de los puntos "P1" y "P2" dados esta más cercano a |

| | | "pbase" sobre el eje de las ordenadas (Eje Y). |
|---------------|--|---|
| =◊ S | NearToOrigen | Determina cuál de los puntos "P1" y "P2" dados está más cercano al origen de coordenadas [0; 0]. |
| ∉\$ | NearToPoint(PointType, List PointType) | Determina que punto de una lista de puntos dada esta más cercano al punto "pbase". |
| =\$ S | NearToPoint(PointType, PointType, PointType) | Determina cuál de los puntos "P1" y "P2" dados está más cercano al punto "pbase". |
| ≡ ∳ S | NormalizeAngle | Normaliza un valor de ángulo. |
| ≡ \$ S | OppositeAngle | Determina dado un ángulo, el valor del ángulo opuesto en el sistema de ejes de coordenadas. |

| | ParallelLineAt | Determina una línea que es paralela a la línea "L" dada y que pasa por el punto "P". |
|--------------|---------------------|---|
| ≅ © S | PerperdicularLineAt | Determina una línea que es perpendicular a la línea "L" dada y que pasa por el punto "P". |
| ∌ S | PointInArc | Determina si el punto "P" dado pertenece al arco "A". |
| =♠ S | PointInCircle | Determina si el punto "P" dado pertenece al circunferencia "C". |
| =\$ S | PointInLine | Determina si el punto "P" dado pertenece la línea "L". |
| ≅ © S | PointInOctant | Determina sobre que octante se ubica el punto "P" dado. |
| ≅ 0 S | PointInQuadrant | Determina el cuadrante en el |

| | | que se ubica el punto dado. |
|--------------|--------------------|---|
| ≅ © S | PointInSegment | Determina si el punto "P" dado pertenece al segmento "S". |
| ≅ © S | PointLineDistance | Determina la distancia un punto "P" a una línea "L" dados. |
| ≡ © S | PointPointAngle | Determina el valor del ángulo que se forma entre segmento que describen los puntos "P1" y "P2" dados y el eje de las abcisas (Eje X). |
| ∃ ∳ S | PointPointDistance | Calcula la distancia entre los puntos "P1" y "P2" dados. |
| ĕ ŵ S | PointPointSlope | Calcula la pendiente de la linea que pasa por los puntos "P1" y "P2" dados. |
| ≅ ∅ S | PolarPoint | Ubica un punto 2D mediante coordenadas polares partir |

| | | de un punto base, un ángulo y una distancia. |
|--------------|------------------------|---|
| =\$ S | PolarToCartesian | Convierte coordenadas Polares a coordenadas Cartesianas. |
| ≡♦ S | PolygonLineIntersect | |
| ≅ © S | RadToGrad | Convierte de Radianes a Grados. |
| =♦ S | RectangleLineIntersect | |
| ≅∲ S | RootMPQ | Calcula las raíces de polinomios de 2do orden que tienen la forma: mx^2 + px + q por el método del Descriminante. |
| =\$ S | RotateArc | Rota en el plano XY el arco 'A' sobre un punto 'pbase' dado según un ángulo especificado. |
| ∉\$ | RotateCircle | Rota en el plano XY el |

| | | circulo 'C' sobre un punto 'pbase' dado según un ángulo especificado. |
|-------------|---------------------------|--|
| =♠ S | RotatePoint | Rota en el plano XY el punto 'P' sobre un punto 'pbase' dado según un ángulo especificado. |
| =\$ | RotateSegment | Rota en el plano XY el segmento 'S' sobre un punto 'pbase' dado según un ángulo especificado. |
| ₫∳ S | SegmentsApparentIntersect | Determina la intercepción aparente en el plano entre dos segmentos. Nota: La intersección aparente indica |
| ≅∲ S | SegmentSegmentAngle | Determina el ángulo según su tipo (agudo u obtuso) que se forma entre |

| | | dos segmentos "S1" y "S2" dadas. |
|--------------|---|--|
| ≅ © S | SegmentSegmentChamfer(SegmentType, SegmentType, ChamferDistante, ChamferAngle, PointType, PointType) | |
| ∃∳ S | SegmentSegmentChamfer(SegmentType, SegmentType, ChamferDistante, ChamferDistante, PointType, PointType) | |
| =\$ | SegmentSegmentFillet(SegmentType, SegmentType, Double, Boolean, Boolean) | Calcula el fillet (EMPALME) entre dos segmentos de rectas "S1" y "S2" dados, con radio determinado por "r_fillet". |
| ≡© S | SegmentSegmentFillet(SegmentType, SegmentType, Double, PointType, PointType, Boolean, Boolean) | Calcula el fillet (EMPALME) entre dos segmentos de rectas "S1" y "S2" dados, con radio determinado por "r_fillet". |
| ≡ Q S | SegmentSegmentFilletSave | |
| ≅ © S | SegmentsRealIntersect | Determina la intercepción real en el plano entre dos segmentos. |

| | | Nota: La intersección real indica que ambos segmentos tienen realmente un punto en común. |
|--------------|----------------|---|
| ≇\$ | SetPresicion | Establece la precision (posiciones decimales) que tiene en cuenta is2Graph para comprobar el valor del Cero Real. |
| ĕ∳ S | SphericalPoint | Ubica un punto 3D mediante coordenadas esféricas. |
| ≅ © S | SwapArc | Intercambia los dos arcos pasados por parámetro. |
| =ℚ S | SwapCircle | Intercambia las dos circunferencias pasados por parámetro. |
| ĕ ŷ S | SwapLine | Intercambia las dos líneas pasados por |

| | | parámetro. |
|--------------|-----------------|---|
| =\$ S | SwapPoint | Intercambia los dos puntos pasados por parámetro. |
| =\$ | SwapSegment | Intercambia los dos segmentos pasados por parámetro. |
| =\$ S | SwapValue | Intercambia los dos valores pasados por parámetro. |
| ≡© | ToString | Returns a string that represents the current object. (Inherited from Object.) |
| =∳ S | TranslateArc | Traslada el arco 'A' las distancias definas por las componentes dx, dy, dz. |
| ≡ © S | TranslateCircle | Traslada el circulo 'C' las distancias definas por las componentes dx, dy, dz. |
| €\$ | TranslatePoint | Traslada el |

punto 'P' las distancias definas por las componentes dx, dy, dz.

₫∳ **S**

TranslateSegment

Traslada el segmento 'S' las distancias definas por las componentes dx, dy, dz.

is2GraphObj Class is2GraphObject Namespace

is2GraphObj AngleInQuadrant Method

Determina el cuadrante en el que se ubica el valor de ángulo dado. Nota: el valor de ángulo esta expresado en grados.

Namespace: is2GraphObject

Assembly: is2GraphObj net4.5 (in is2GraphObj net4.5.dll) Version:

angle

Type: System Double

Valor de ángulo en grados.

Return Value

Type: Cuadrante

Devuelve un tipo enum que representa el cuadrante en que se ubica el ángulo dado.

Reference

is2GraphObj Class is2GraphObject Namespace

is2GraphObj ArcArcFillet Method (ArcType, ArcType, Double, Boolean, Boolean, Boolean)

Calcula el fillet (EMPALME) entre dos arcos de circunferencias "A1" y "A2" dados, con radio determinado por "r_fillet".

Namespace: is2GraphObject

Assembly: is2GraphObj_net4.5 (in is2GraphObj_net4.5.dll) Version:

A1

Type: is2GraphObject ArcType

Representa el 1er arco de circunferecia.

A2

Type: is2GraphObject ArcType

Representa el 2do arco de circunferencia.

r_fillet

Type: System Double

Representa el radio del fillet.

right_up (Optional)

Type: System Boolean

Indica hacia que lado se calcula el fillet, tomando como referencia el segmento imaginario "Sx" que se forma entre los centros de ambos arcos.

Nota: Si el valor es **true**, el fillet se calcula hacia la derecha-o-arriba del segmento "Sx". Por el contrario si el valor es **false**, el fillet se calcula hacia la izquierda-o-abajo del segmento.

a1_outside (Optional)

Type: System Boolean

Indica si el fillet se calcula hacia adentro o hacia afuera de la circunferencia imaginaria que forma el arco "A1".

Nota: Si el valor es **true**, el fillet se calcula hacia el exterior de la circunferencia. Por el contrario si el valor es **false**, el fillet se calcula hacia el interior de la circunferencia. En ambos casos su

aplicación es sobre la circunferencia "C1".

a2_outside (Optional)

Type: System Boolean

Indica si el fillet se calcula hacia adentro o hacia afuera de la circunferencia imaginaria que forma el arco "A2".

Nota: Si el valor es **true**, el fillet se calcula hacia el exterior de la circunferencia. Por el contrario si el valor es **false**, el fillet se calcula hacia el interior de la circunferencia. En ambos casos su aplicación es sobre la circunferencia "C2".

Return Value

Type: ArcType

Devuelve un tipo Arco que representa el fillet calculado los dos arcos de circunferencias dados.

▲ See Also

is2GraphObj Class ArcArcFillet Overload is2GraphObject Namespace

is2GraphObj ArcArcFillet Method (ArcType, ArcType, Double, PointType, PointType, PointType, Boolean, Boolean, Boolean)

Calcula el fillet (EMPALME) entre dos arcos de circunferencias "A1" y "A2" dados, con radio determinado por "r fillet".

Namespace: is2GraphObject

Assembly: is2GraphObj net4.5 (in is2GraphObj net4.5.dll) Version:

```
public static void ArcArcFillet(
    ArcType A1,
    ArcType A2,
    double r_fillet,
    out PointType P1,
    out PointType P2,
    out PointType Pc,
    bool right_up = true,
    bool a1_outside = true,
    bool a2_outside = true
)
```

A1

Type: is2GraphObject ArcType

Representa el 1er arco de circunferecia.

A2

Type: is2GraphObject ArcType

Representa el 2do arco de circunferencia.

r fillet

Type: System Double

Representa el radio del fillet.

P1

Type: is2GraphObject PointType

Parámetro de salida (out). Retorna por referencia el punto del arcfillet que pertenece a la circunferenca.

P2

Type: is2GraphObject PointType

Parámetro de salida (out). Retorna por referencia el punto del arcfillet que pertenece al segmento de recta.

PC

Type: is2GraphObject PointType

Parámetro de salida (out). Retorna por referencia el punto centro del arc-fillet.

right_up (Optional)

Type: System Boolean

Indica hacia que lado se calcula el fillet, tomando como referencia el segmento imaginario "Sx" que se forma entre los centros de ambos arcos.

Nota: Si el valor es **true**, el fillet se calcula hacia la derecha-o-arriba del segmento "Sx". Por el contrario si el valor es **false**, el fillet se calcula hacia la izquierda-o-abajo del segmento.

a1_outside (Optional)

Type: System Boolean

Indica si el fillet se calcula hacia adentro o hacia afuera de la circunferencia imaginaria que forma el arco "A1".

Nota: Si el valor es **true**, el fillet se calcula hacia el exterior de la circunferencia. Por el contrario si el valor es **false**, el fillet se calcula hacia el interior de la circunferencia. En ambos casos su aplicación es sobre la circunferencia "C1".

a2_outside (Optional)

Type: System Boolean

Indica si el fillet se calcula hacia adentro o hacia afuera de la circunferencia imaginaria que forma el arco "A2".

Nota: Si el valor es **true**, el fillet se calcula hacia el exterior de la circunferencia. Por el contrario si el valor es **false**, el fillet se calcula hacia el interior de la circunferencia. En ambos casos su aplicación es sobre la circunferencia "C2".

Return Value

Type:

Devuelve un tipo void. Por referencia mediante los parámetros P1, P2 y Pc se obtienen los 3 puntos del arc-fillet.

▲ Remarks Nota: "P1" pertenece al arco "A1", "P2" pertenece al arco "A2" y "Pc" es el centro del arco.

■ See Also

is2GraphObj ArcArcIntersect Method

Calcula el o los puntos de intercepcion entre dos arcos de circunferencias.

Namespace: is2GraphObject

Assembly: is2GraphObj_net4.5 (in is2GraphObj_net4.5.dll) Version:

```
public static byte ArcArcIntersect(
    ArcType A1,
    ArcType A2,
    out PointType P1,
    out PointType P2
)
```

A1

Type: is2GraphObject ArcType

Primer arco.

A2

Type: is2GraphObject ArcType

Segundo arco.

P1

Type: is2GraphObject PointType

Parámetro de salida (out). Retorna por referencia uno de los puntos de intersección, si existe.

P2

Type: is2GraphObject PointType

Parámetro de salida (out). Retorna por referencia el otro punto de intersección, si existe.

Return Value

Type: Byte

Devuelve un valor entero corto que indica lo siguiente:

- 0 Los arcos no intersectan entre si.
- 1 Los arcos se intersectan en un único punto.
- 2 Los arcos se intersectan en dos puntos.
- ▲ Remarks Si los arcos de circunferencia no se interceptan, entonces "P1" y "P2" retornarán NULL.
- Si los arcos de circunferencia se interceptan en un solo punto, entonces "P1" y "P2" son iguales.

- Si los arcos de circunferencia se interceptan en dos puntos, entonces "P1" y "P2" son distintos.

is2GraphObj Class

is2GraphObject Namespace

is2GraphObj CartesianToPolar Method

Convierte coordenadas Cartesianas a coordenadas Polares.

Namespace: is2GraphObject

Assembly: is2GraphObj_net4.5 (in is2GraphObj_net4.5.dll) Version:

dX

Type: System Double

Coordena X en el sistema cartesiano. Tambien se interpreta como desplazamiento a partir del punto "pbase" sobre el eje de las abcisas (Eje X).

dY

Type: System Double

Coordena Y en el sistema cartesiano. Tambien se interpreta como desplazamiento a partir del punto "pbase" sobre el eje de las ordenadas (Eje Y).

angle

Type: System Double

Parámetro de salida (out). Retorna por referencia la componente angular del sistema de coordenadas polares.

dist

Type: System Double

Parámetro de salida (out). Retorna por referencia la componente distacia del sistema de coordenadas polares.

pbase (Optional)

Type: is2GraphObject PointType

Define el punto base que se usa como origen para calcular las componentes angular y distancia. Si "pbase" es igual a null se asume como punto base el Origen del Sistema de Coordenadas (0,0,0).

Return Value

Type:

Devuelve un tipo void. Por referencia se devuelve las componentes angular y distancia del Sistema de Coordenadas Polares.

is2GraphObj Class is2GraphObject Namespace

is2GraphObj CircleCircleFillet Method (CircleType, CircleType, Double, Boolean, Boolean, Boolean)

Calcula el fillet (EMPALME) entre dos circunferencias "C1" y "C2" dados, con radio determinado por "r_fillet".

Namespace: is2GraphObject

Assembly: is2GraphObj net4.5 (in is2GraphObj net4.5.dll) Version:

C1

Type: is2GraphObject CircleType Representa la 1ra circunferecia.

C2

Type: is2GraphObject CircleType Representa la 2da circunferencia.

r_fillet

Type: System Double

Representa el radio del fillet.

right_up (Optional)

Type: System Boolean

Indica hacia que lado se calcula el fillet, tomando como referencia el segmento imaginario "Sx" que se forma entre los centros de ambas circunferencias.

Nota: Si el valor es **true**, el fillet se calcula hacia la derecha-o-arriba del segmento "Sx". Por el contrario si el valor es **false**, el fillet se calcula hacia la izquierda-o-abajo del segmento.

c1_outside (Optional)

Type: System Boolean

Indica si el fillet se calcula hacia adentro o hacia afuera de la circunferencia "C1".

Nota: Si el valor es **true**, el fillet se calcula hacia el exterior de la circunferencia. Por el contrario si el valor es **false**, el fillet se calcula hacia el interior de la circunferencia. En ambos casos su

aplicación es sobre la circunferencia "C1".

c2_outside (Optional)

Type: System Boolean

Indica si el fillet se calcula hacia adentro o hacia afuera de la circunferencia "C2".

Nota: Si el valor es **true**, el fillet se calcula hacia el exterior de la circunferencia. Por el contrario si el valor es **false**, el fillet se calcula hacia el interior de la circunferencia. En ambos casos su aplicación es sobre la circunferencia "C2".

Return Value

Type: ArcType

Devuelve un tipo Arco que representa el fillet calculado las dos circunferencias dadas.

is2GraphObj Class CircleCircleFillet Overload is2GraphObject Namespace is2GraphObject ArcType is2GraphObject CircleType

is2GraphObj CircleCircleFillet Method (CircleType, CircleType, Double, PointType, PointType, PointType, Boolean, Boolean, Boolean)

Calcula el fillet (EMPALME) entre dos circunferencias "C1" y "C2" dados, con radio determinado por "r fillet".

Namespace: is2GraphObject

Assembly: is2GraphObj_net4.5 (in is2GraphObj_net4.5.dll) Version:

C1

Type: is2GraphObject CircleType Representa la 1ra circunferecia.

C2

Type: is2GraphObject CircleType Representa la 2da circunferencia.

r fillet

Type: System Double

Representa el radio del fillet.

P1

Type: is2GraphObject PointType

Parámetro de salida (out). Retorna por referencia el punto del arcfillet que pertenece a la circunferenca.

P2

Type: is2GraphObject PointType

Parámetro de salida (out). Retorna por referencia el punto del arcfillet que pertenece al segmento de recta.

PC

Type: is2GraphObject PointType

Parámetro de salida (out). Retorna por referencia el punto centro del arc-fillet.

right_up (Optional)

Type: System Boolean

Indica hacia que lado se calcula el fillet, tomando como referencia el segmento imaginario "Sx" que se forma entre los centros de ambas circunferencias.

Nota: Si el valor es **true**, el fillet se calcula hacia la derecha-o-arriba del segmento "Sx". Por el contrario si el valor es **false**, el fillet se calcula hacia la izquierda-o-abajo del segmento.

c1_outside (Optional)

Type: System Boolean

Indica si el fillet se calcula hacia adentro o hacia afuera de la circunferencia "C1".

Nota: Si el valor es **true**, el fillet se calcula hacia el exterior de la circunferencia. Por el contrario si el valor es **false**, el fillet se calcula hacia el interior de la circunferencia. En ambos casos su aplicación es sobre la circunferencia "C1".

c2_outside (Optional)

Type: System Boolean

Indica si el fillet se calcula hacia adentro o hacia afuera de la circunferencia "C2".

Nota: Si el valor es **true**, el fillet se calcula hacia el exterior de la circunferencia. Por el contrario si el valor es **false**, el fillet se calcula hacia el interior de la circunferencia. En ambos casos su aplicación es sobre la circunferencia "C2".

Return Value

Type:

Devuelve un tipo void. Por referencia mediante los parámetros P1, P2 y Pc se obtienen los 3 puntos del arc-fillet.

■ Remarks Nota: "P1" pertenece a la circunferecia "C1", "P2" pertenece a la circunferencia "C2" y "Pc" es el centro del arco.

```
public static byte CircleCircleIntersect(
    CircleType C1,
    CircleType C2,
    out PointType P1,
    out PointType P2
```

C1

Type: is2GraphObject CircleType

Primera circunferencia.

C2

Type: is2GraphObject CircleType

Segunda circunferencia.

P1

Type: is2GraphObject PointType

Parámetro de salida (out). Retorna por referencia uno de los puntos de intersección, si existe.

P2

Type: is2GraphObject PointType

Parámetro de salida (out). Retorna por referencia el otro punto de intersección, si existe.

Return Value

Type: Byte

Devuelve un valor entero corto que indica lo siguiente:

- 0 Las circunferencias son exteriores. No existen puntos de intersección.
- 1 Las circunferencias son tangentes. Existe solo un punto de intersección.
- 2 Las circunferencia son secantes. Existen dos puntos de intersección.
- Remarks Si las circunferencias son exteriores, entonces "P1"

y "P2" retornarán NULL.

- Si las circunferencias son tangente, entonces solo existe un punto de intersección por lo que "P1" y "P2" serán iguales.
- Si las circunferecias son secantes, entonces "P1" y "P2" serán distintos.

is2GraphObj CircleSegmentFillet Method (CircleType, SegmentType, Double, Boolean, Boolean, Boolean)

Calcula el fillet (EMPALME) entre una circunferencia "C" y un segmento de recta "S" dados, con radio determinado por "r_fillet".

Namespace: is2GraphObject

Assembly: is2GraphObj_net4.5 (in is2GraphObj_net4.5.dll) Version:

C

Type: is2GraphObject CircleType

Representa la circunferecia.

S

Type: is2GraphObject SegmentType

Representa el segmento de recta.

r_fillet

Type: System Double

Representa el radio del fillet.

right (Optional)

Type: System Boolean

Indica hacia que lado del segmento "S" dado se calcula el fillet (empalme). Los lados quedan determinados por la recta que parte del centro de la circunferencia "C" y es perpendicular al segmento "S". Si el valor es **true** el fillet se calcula hacia la derecha del segmento "S", por el contrario si el valor es **false** el fillet se calcula hacia la izquierda de dico segmento.

outside (Optional)

Type: System Boolean

Indica si el fillet (empalme) se calcula exterior o interior a la circunferencia "C" dada. Si el valor es **true** el fillet se calcula exterior a la circunferencia, por el contrario si el valor es **false** el fillet se calcula hacia el interior de la circunferencia.

up (Optional)

Type: System Boolean

Indica si el fillet se calcula sobre el segmento "S" dado o por debajo de él. Si el valor es **true** el fillet se calcula sobre el segmento "S" dado, por el contrario si el valor es **false** el fillet se calcula por debajo de dicho segmento.

Return Value

Type: ArcType

Devuelve un tipo Arco que representa el fillet calculado entre la circunferencia y el segmento de recta dados.

▲ Exceptions

| Exception | Condition |
|-----------------|--|
| FilletException | Se lanza cuando se intenta crear un fillet cuyo valor de radio no lo permite por ser o muy pequeño o muy grande. |

Determina cuál de los puntos "P1" y "P2" dados está más lejano del origen de coordenadas [0; 0].

Namespace: is2GraphObject

Assembly: is2GraphObj_net4.5 (in is2GraphObj_net4.5.dll) Version:

```
public static PointType FarToOrigen(
PointType P1,
PointType P2
```

P1

Type: is2GraphObject PointType

Primer punto.

P2

Type: is2GraphObject PointType

Segundo punto.

Return Value

Type: PointType

Devuelve el punto más alejado del origen de coordenadas.

Determina de una lista de puntos definidas por "list" el punto más alejado del punto base "pbase".

Namespace: is2GraphObject

Assembly: is2GraphObj net4.5 (in is2GraphObj net4.5.dll) Version:

```
public static PointType FarToPoint(
    PointType pbase,
    List<PointType> list
)
```

pbase

Type: is2GraphObject PointType

Punto base o de referencia respecto al cuál se calculará la lejanía.

list

Type: System.Collections.Generic List PointType

Lista de puntos a comprobar.

Return Value

Type: PointType

Devuelve el punto más lejano al punto "pbase".

Reference

is2GraphObj Class is2GraphObject Namespace

is2GraphObj isColinearSegment Method

Determina si dos segmetos "S1" y "S2" dados son colineales.

Namespace: is2GraphObject

Assembly: is2GraphObj_net4.5 (in is2GraphObj_net4.5.dll) Version:

```
public static bool isColinearSegment(
    SegmentType S1,
    SegmentType S2
)
```

S1

Type: is2GraphObject SegmentType

Primer segmento.

S2

Type: is2GraphObject SegmentType

Segundo segmento.

Return Value

Type: Boolean

Devuelve **true** si ambos segmentos son colineales. En caso contrario devuelve **false**.

▲ Remarks Se define la condición de colinealidad de dos segmentos si estos pertenecen a una misma recta.

▲ See Also

is2GraphObj isEqualArc Method

Comprueba si dos arcos dados "A1" y "A2" son iguales.

Namespace: is2GraphObject

Assembly: is2GraphObj_net4.5 (in is2GraphObj_net4.5.dll) Version:

```
public static bool isEqualArc(
    ArcType A1,
    ArcType A2
```

A1

Type: is2GraphObject ArcType

Primer arcos.

A2

Type: is2GraphObject ArcType

Segundo arco.

Return Value

Type: Boolean

Devuelve **true** si ambos arcos son iguales. En caso contrario devuelve **false**.

▲ See Also

Reference

is2GraphObj LineAccordingLineAt Method

Determina una línea que pasa por el punto "P" y que forma con la línea "L" dada, un ángulo determinado por el parámetro "angle".

Namespace: is2GraphObject

Assembly: is2GraphObj net4.5 (in is2GraphObj net4.5.dll) Version:

```
public static LineType LineAccordingLineAt(
    LineType L,
    PointType P,
    double angle
)
```

L

Type: is2GraphObject LineType

Línea a partir de la cual se determina la otra línea que forma con esta un angulo determinado.

P

Type: is2GraphObject PointType

Punto por el que pasa la línea oblicua a calcular.

angle

Type: System Double

Valor de ángulo en grados.

Return Value

Type: LineType

Devuelve un línea que pasa por el punto "P" y que es oblicua a la linea "L" formando un ángulo determinado.

is2GraphObj LineCoefficient Method (LineType, Double, Double, Double)

Determina los coeficientes de la ecuación general de la recta (Ax + By + C = 0) para la recta 'L' dada.

Namespace: is2GraphObject

Assembly: is2GraphObj_net4.5 (in is2GraphObj_net4.5.dll) Version:

1.0.0.0 (1.0.0.0)

■ Syntax

```
public static void LineCoefficient(
    LineType L,
    out double A,
    out double B,
    out double C
```

L

Type: is2GraphObject LineType

Representa el segmento.

A

Type: System Double

Parámetro de salida (out). Retorna por referencia el valor del coeficiente A.

B

Type: System Double

Parámetro de salida (out). Retorna por referencia el valor del coeficiente B.

C

Type: System Double

Parámetro de salida (out). Retorna por referencia el valor del coeficiente C.

Return Value

Type:

Devuelve un tipo void. Por referencia mediante los parámetros A, B, C se obtienen los coeficientes de la ecuación.

is2GraphObj LineLineAngle Method

Determina el ángulo según su tipo (agudo u obtuso) que se forma entre dos líneas "L1" y "L2" dadas.

Namespace: is2GraphObject

Assembly: is2GraphObj net4.5 (in is2GraphObj net4.5.dll) Version:

```
public static double LineLineAngle(
    LineType L1,
    LineType L2,
    bool agude = true
)
```

L1

Type: is2GraphObject LineType

Primera línea.

L2

Type: is2GraphObject LineType

Segunda línea. agude (Optional)

Type: System Boolean

Indica el tipo de ángulo que se quiere calcular. Si es **true** se calcula el valor para el ángulo agudo, por el contrario si es **false** se calcula el valor del angulo obtuso.

Return Value

Type: Double

Devuelve el ángulo en grados (agudo u obtuso) que se forma entre las líneas dadas.

is2GraphObj LineLineIntersect Method

Calcula el punto de intercepción entre dos líneas.

Namespace: is2GraphObject

Assembly: is2GraphObj_net4.5 (in is2GraphObj_net4.5.dll) Version:

```
public static bool LineLineIntersect(
    LineType L1,
    LineType L2,
    out PointType P
```

11

Type: is2GraphObject LineType

Primera línea.

L2

Type: is2GraphObject LineType

Segunda línea.

P

Type: is2GraphObject PointType

Parámetro de salida (out). Retorna por referencia el punto de intercepción entre las dos líneas, si existe.

Nota: Si las líneas no se intersectan el parámetro "P" retorna NULL.

Return Value

Type: Boolean

Devuelve **true** si ambas lineas se intercertan en el plano. En caso contrario devuelve **false**.

Determina las rectas tangentes a la circunferecia "C" dada y que pasan por el punto "P".

Namespace: is2GraphObject

Assembly: is2GraphObj net4.5 (in is2GraphObj net4.5.dll) Version:

```
public static void LineTangentToCircle(
    CircleType C,
    PointType P,
    out LineType L1,
    out LineType L2
)
```

C

Type: is2GraphObject CircleType

Circunferencia para que le se quieren calcular las rectas tangentes y que pasan por el punto dado.

P

Type: is2GraphObject PointType

Punto por el que pasan las rectas tangentes a la circunferencia.

1 1

Type: is2GraphObject LineType

Parámetro de salida (out). Retorna por referencia la primera de las líneas tangentes a la circunfenrencia.

L2

Type: is2GraphObject LineType

Parámetro de salida (out). Retorna por referencia la segunda de las líneas tangentes a la circunfenrencia.

Return Value

Type:

Devuelve un tipo void. Por referencia devuelve las dos lineas que cumplen con la propiedad de pasar por el punto dado y ser tangente a la circunferecia.

is2GraphObj NearToPoint Method (PointType, List PointType)

Determina que punto de una lista de puntos dada esta más cercano al punto "pbase".

Namespace: is2GraphObject

Assembly: is2GraphObj net4.5 (in is2GraphObj net4.5.dll) Version:

```
public static PointType NearToPoint(
    PointType pbase,
    List<PointType> list
)
```

pbase

Type: is2GraphObject PointType

Punto base o de referencia respecto al cuál se calculará la carcanía

list

Type: System.Collections.Generic List PointType

Lista de puntos a comprobar.

Return Value

Type: PointType

Devuelve el punto más cercano al punto "pbase".

▲ See Also

Reference

is2GraphObj Class NearToPoint Overload is2GraphObject Namespace is2GraphObject PointType

is2GraphObj NearToPoint Method (PointType, PointType, PointType)

Determina cuál de los puntos "P1" y "P2" dados está más cercano al punto "pbase".

Namespace: is2GraphObject

Assembly: is2GraphObj_net4.5 (in is2GraphObj_net4.5.dll) Version:

```
public static PointType NearToPoint(
    PointType pbase,
    PointType P1,
    PointType P2
)
```

pbase

Type: is2GraphObject PointType

Punto base o de referencia respecto al cuál se calculará la

cercania

P1

Type: is2GraphObject PointType

Primer punto.

P2

Type: is2GraphObject PointType

Segundo punto.

Return Value

Type: PointType

Devuelve el punto más cercano al punto base dado.

is2GraphObj NormalizeAngle Method

Normaliza un valor de ángulo.

Namespace: is2GraphObject

Assembly: is2GraphObj_net4.5 (in is2GraphObj_net4.5.dll) Version:

angle

Type: System Double

Valor de ángulo en grados.

Return Value

Type: Double

Devuelve ángulo en grados normalizado.

▲ Remarks El proceso de Normalización garantiza que un valor de angulo no exceda los 360 grados, para lo cuál se calcula ??

▲ See Also

Reference

is2GraphObj OppositeAngle Method

Determina dado un ángulo, el valor del ángulo opuesto en el sistema de ejes de coordenadas.

Namespace: is2GraphObject

Assembly: is2GraphObj net4.5 (in is2GraphObj net4.5.dll) Version:

angle

Type: System Double

Valor de ángulo en grados.

Return Value

Type: Double

Devuelve el valor de ángulo opuesto al ángulo dado.

▲ See Also

Reference

is2GraphObj ParallelLineAt Method

Determina una línea que es paralela a la línea "L" dada y que pasa por el punto "P".

Namespace: is2GraphObject

Assembly: is2GraphObj_net4.5 (in is2GraphObj_net4.5.dll) Version:

```
public static LineType ParallelLineAt(
    LineType L,
    PointType P
)
```

L

Type: is2GraphObject LineType

Línea a partir de la cual se determina la otra línea que es paralela a esta.

P

Type: is2GraphObject PointType

Punto por el que pasa la línea paralela a calcular.

Return Value

Type: LineType

Devuelve un línea que es paralela a la linea "L" dada y que pasa por el punto "P".

■ See Also

Reference

is2GraphObj PerperdicularLineAt Method

Determina una línea que es perpendicular a la línea "L" dada y que pasa por el punto "P".

Namespace: is2GraphObject

Assembly: is2GraphObj net4.5 (in is2GraphObj net4.5.dll) Version:

```
public static LineType PerperdicularLineAt(
    LineType L,
    PointType P
```

L

Type: is2GraphObject LineType

Línea a partir de la cual se determina la otra línea que es perpendicular a esta.

P

Type: is2GraphObject PointType

Punto por el que pasa la línea perpendicar a calcular.

Return Value

Type: LineType

Devuelve un linea que es perperdicular a la linea "L" dada y que pasa por el punto "P".

is2GraphObj PointInArc Method

Determina si el punto "P" dado pertenece al arco "A".

Namespace: is2GraphObject

Assembly: is2GraphObj_net4.5 (in is2GraphObj_net4.5.dll) Version:

P

Type: is2GraphObject PointType

Punto que se quiere comprobar si pertenece al arco dado.

A

Type: is2GraphObject ArcType

Arco para el cuál se quiere comprobar la pertenencia de un punto.

Return Value

Type: Boolean

Devuelve **true** si el punto dado pertenece al arco. En caso contrario devuelve **false**.

▲ See Also

Reference

is2GraphObj Class is2GraphObject Namespace is2GraphObject ArcType is2GraphObject PointType

is2GraphObj PointInCircle Method

Namespace: is2GraphObject

Assembly: is2GraphObj_net4.5 (in is2GraphObj_net4.5.dll) Version:

P

Type: is2GraphObject PointType

Punto que se quiere comprobar si pertenece a la circunferencia

C

Type: is2GraphObject CircleType

Circunferencia para la cuál se quiere comprobar la pertenencia de un punto.

Return Value

Type: Boolean

Devuelve **true** si el punto dado pertenece a la circunferencia. En caso contrario devuelve **false**.

■ See Also

Reference

is2GraphObj Class is2GraphObject Namespace is2GraphObject CircleType is2GraphObject PointType

is2GraphObj PointInLine Method

Determina si el punto "P" dado pertenece la línea "L".

Namespace: is2GraphObject

Assembly: is2GraphObj_net4.5 (in is2GraphObj_net4.5.dll) Version:

P

Type: is2GraphObject PointType

Punto que se quiere comprobar si pertenece a la línea dada.

L

Type: is2GraphObject LineType

Línea a la que se quiere comprobar la pertenencia de un punto.

Return Value

Type: Boolean

Devuelve **true** si el punto dado pertenece a la línea. En caso contrario devuelve **false**.

▲ See Also

is2GraphObj PointInOctant Method

Determina sobre que octante se ubica el punto "P" dado.

Namespace: is2GraphObject

Assembly: is2GraphObj_net4.5 (in is2GraphObj_net4.5.dll) Version:

P

Type: is2GraphObject PointType

Punto a comprobar.

Return Value

Type: Octante

Devuelve el octante en que se ubica el punto dado.

▲ See Also

Reference

is2GraphObj PointInQuadrant Method

Determina el cuadrante en el que se ubica el punto dado.

Namespace: is2GraphObject

Assembly: is2GraphObj_net4.5 (in is2GraphObj_net4.5.dll) Version:

P

Type: is2GraphObject PointType Representa el punto a comprobar.

Return Value

Type: Cuadrante

Devuelve un tipo enum que representa el cuadrante en que se ubica el punto dado.

▲ See Also

Reference

is2GraphObj PointInSegment Method

Determina si el punto "P" dado pertenece al segmento "S".

Namespace: is2GraphObject

Assembly: is2GraphObj_net4.5 (in is2GraphObj_net4.5.dll) Version:

P

Type: is2GraphObject PointType

Punto que se quiere comprobar si pertenece al segmento dada.

S

Type: is2GraphObject SegmentType

Segmento al cuál se le quiere comprobar la pertenencia de un punto.

Return Value

Type: Boolean

Devuelve **true** si el punto dado pertenece al segmento. En caso contrario devuelve **false**.

▲ See Also

Reference

is2GraphObj Class is2GraphObject Namespace is2GraphObject SegmentType is2GraphObject PointType

is2GraphObj PointLineDistance Method

Determina la distancia un punto "P" a una línea "L" dados.

Namespace: is2GraphObject

Assembly: is2GraphObj_net4.5 (in is2GraphObj_net4.5.dll) Version:

```
public static double PointLineDistance(
          PointType P,
          LineType L
)
```

Type: is2GraphObject PointType
Representa el punto.

L
Type: is2GraphObject LineType
Representa la línea.

Return Value

Type: Double

Devuelve la distancia de un punto a una línea.

▲ See Also

Reference

is2GraphObj PointPointAngle Method

Determina el valor del ángulo que se forma entre segmento que describen los puntos "P1" y "P2" dados y el eje de las abcisas (Eje X).

Namespace: is2GraphObject

Assembly: is2GraphObj net4.5 (in is2GraphObj net4.5.dll) Version:

```
public static double PointPointAngle(
PointType P1,
PointType P2
)
```

P1

Type: is2GraphObject PointType

Primer punto.

P2

Type: is2GraphObject PointType

Segundo punto.

Return Value

Type: Double

Devuelve el ángulo en grados del segmento que se forma entre los punto "P1" y "P2".

▲ See Also

Reference

is2GraphObj PointPointDistance Method

Calcula la distancia entre los puntos "P1" y "P2" dados.

Namespace: is2GraphObject

Assembly: is2GraphObj_net4.5 (in is2GraphObj_net4.5.dll) Version:

```
public static double PointPointDistance(
    PointType P1,
    PointType P2
)
```

P1

Type: is2GraphObject PointType

Primer punto.

P2

Type: is2GraphObject PointType

Segundo punto.

Return Value

Type: Double

Devuelve un double que expresa el valor de la distancia entre dos puntos.

▲ See Also

Reference

is2GraphObj PointPointSlope Method

Calcula la pendiente de la linea que pasa por los puntos "P1" y "P2" dados.

Namespace: is2GraphObject

Assembly: is2GraphObj net4.5 (in is2GraphObj net4.5.dll) Version:

```
public static double PointPointSlope(
          PointType P1,
          PointType P2
)
```

P1

Type: is2GraphObject PointType

Representa uno de los puntos por donde pasa la línea a la que se le guiere determinar su de pendiente.

P2

Type: is2GraphObject PointType

Representa el otro punto por donde pasa la línea.

Return Value

Type: Double

Devuelve un double que expresa el valor de la pendiente de la recta. Devuelve un valor NaN (Not a Number) si ambos puntos tienen iguales la coordenada X, lo que significa que la recta es vertical (es decir, es paralela al eje de las ordenadas).

▲ See Also

Reference

is2GraphObj PolarPoint Method

Ubica un punto 2D mediante coordenadas polares partir de un punto base, un ángulo y una distancia.

Namespace: is2GraphObject

Assembly: is2GraphObj_net4.5 (in is2GraphObj_net4.5.dll) Version:

```
public static PointType PolarPoint(
    PointType pbase,
    double angle,
    double distance
)
```

pbase

Type: is2GraphObject PointType

Punto de referencia a partir del cuál se calcula el nuevo punto mediante el sistema de coordenadas polares.

angle

Type: System Double

Componente angular para el sistema de coordenadas polares.

distance

Type: System Double

Componente distancia para el sistema de coordenadas polares.

Return Value

Type: PointType

Devuelve el punto ubicado por coordenadas polares.

■ See Also

Reference

is2GraphObj PolarToCartesian Method

Convierte coordenadas Polares a coordenadas Cartesianas.

Namespace: is2GraphObject

Assembly: is2GraphObj_net4.5 (in is2GraphObj_net4.5.dll) Version:

angle

Type: System Double

Representa el valor del ángulo dado en grados en el sistema de coordenadas polares.

dist

Type: System Double

Representa el valor de distancia (radio) en el sistema de coordenadas polares.

dX

Type: System Double

Parámetro de salida (out). Retorna por referencia la componente dX del punto.

dY

Type: System Double

Parámetro de salida (out). Retorna por referencia la componente dY del punto.

pbase (Optional)

Type: is2GraphObject PointType

Define el punto base que se usa como origen para calcular las componentes dX y dY. Si "pbase" es igual a null se asume como punto base el Origen del Sistema de Coordenadas (0,0,0).

Return Value

Type:

Devuelve un tipo void. Por referencia se devuelve las componentes dX y dY.

is2GraphObj Class is2GraphObject Namespace

is2GraphObj SegmentSegmentFillet Method (SegmentType, SegmentType, Double, Boolean, Boolean)

Calcula el fillet (EMPALME) entre dos segmentos de rectas "S1" y "S2" dados, con radio determinado por "r_fillet".

Namespace: is2GraphObject

Assembly: is2GraphObj net4.5 (in is2GraphObj net4.5.dll) Version:

```
public static ArcType SegmentSegmentFillet(
    SegmentType S1,
    SegmentType S2,
    double r_fillet,
    bool s1_right_up = true,
    bool s2_right_up = true
)
```

S1

Type: is2GraphObject SegmentType

Representa el 1er segmento.

S2

Type: is2GraphObject SegmentType

Representa el 2do segmento.

r fillet

Type: System Double

Representa el radio del fillet.

s1_right_up (Optional)

Type: System Boolean

Determina hacia que lado del segmento "S1" se calcula el fillet.

Nota: Si el valor es **true**, el fillet se calcula hacia la derecha-o-arriba del segmento. Por el contrario si el valor es **false**, el fillet se calcula hacia la izquierda-o-abajo del segmento. En ambos casos su aplicación es sobre el segmento "S1".

s2_right_up (Optional)

Type: System Boolean

Determina hacia que lado del segmento "S2" se calcula el fillet.

Nota: Si el valor es **true**, el fillet se calcula hacia la derecha-o-arriba del segmento. Por el contrario si el valor es **false**, el fillet se calcula hacia la izquierda-o-abajo del segmento. En ambos casos su aplicación es sobre el segmento "S2".

Return Value

Type: ArcType

Devuelve un tipo Arco que representa el fillet entre los dos segmentos dados.

▲ See Also

Reference

is2GraphObj Class SegmentSegmentFillet Overload is2GraphObject Namespace is2GraphObject SegmentType

is2GraphObj SegmentSegmentFillet Method (SegmentType, SegmentType, Double, PointType, PointType, PointType, Boolean, Boolean)

Calcula el fillet (EMPALME) entre dos segmentos de rectas "S1" y "S2" dados, con radio determinado por "r_fillet".

Namespace: is2GraphObject

Assembly: is2GraphObj net4.5 (in is2GraphObj net4.5.dll) Version:

S1

Type: is2GraphObject SegmentType

Representa el 1er segmento.

S2

Type: is2GraphObject SegmentType

Representa el 2do segmento.

r fillet

Type: System Double

Representa el radio del fillet.

P1

Type: is2GraphObject PointType

Parámetro de salida (out). Retorna por referencia el punto del arcfillet que pertenece al segmento "S1".

P2

Type: is2GraphObject PointType

Parámetro de salida (out). Retorna por referencia el punto del arcfillet que pertenece al segmento "S2".

Pc

Type: is2GraphObject PointType

Parámetro de salida (out). Retorna por referencia el punto centro del arc-fillet.

s1_right_up (Optional)

Type: System Boolean

Determina hacia que lado del segmento "S1" se calcula el fillet.

Si el valor es **true**, el fillet se calcula hacia la derecha-o-arriba del segmento. Por el contrario si el valor es **false**, el fillet se calcula hacia la izquierda-o-abajo del segmento. En ambos casos su aplicación es sobre el segmento "S1".

s2_right_up (Optional)

Type: System Boolean

Determina hacia que lado del segmento "S2" se calcula el fillet.

Nota:Si el valor es **true**, el fillet se calcula hacia la derecha-o-arriba del segmento. Por el contrario si el valor es **false**, el fillet se calcula hacia la izquierda-o-abajo del segmento. En ambos casos su aplicación es sobre el segmento "S2".

Return Value

Type: Boolean

Nota:Devuelve un tipo void. Por referencia mediante los parámetros P1, P2 y Pc se obtienen los 3 puntos del arc-fillet.

▲ Remarks Nota: "P1" pertenece al segmento "S1", "P2" pertenece al segmento "S2" y "Pc" es el centro del arco.

▲ See Also

Reference is2GraphObj Class is2GraphObject Namespace

is2GraphObj SegmentsRealIntersect Method

Determina la intercepción real en el plano entre dos segmentos. **Nota:** La intersección real indica que ambos segmentos tienen realmente un punto en común.

Namespace: is2GraphObject

Assembly: is2GraphObj_net4.5 (in is2GraphObj_net4.5.dll) Version:

```
public static bool SegmentsRealIntersect(
    SegmentType S1,
    SegmentType S2,
    out PointType P
)
```

S1

Type: is2GraphObject SegmentType

Primer segmento.

S2

Type: is2GraphObject SegmentType

Segundo segmento.

P

Type: is2GraphObject PointType

Parámetro de salida (out). Retorna por referencia el punto de intercepción entre los dos segmentos, si existe.

Nota: Si los segmentos no se intersectan por ser colineales o paralels entre si, el parámetro "P" retorna NULL.

Return Value

Type: Boolean

Devuelve **true** si ambos segmentos se intercertan realmente en el plano. En caso contrario devuelve **false**.

RectangleType Class is2GraphObject Namespace

SegmentType Class

Representa un tipo Segmento. Un segmento se define por dos puntos.

■ Inheritance Hierarchy System Object is2GraphObject SegmentType

Namespace: is2GraphObject

Assembly: is2GraphObj_net4.5 (in is2GraphObj_net4.5.dll) Version:

C# public class SegmentType

The **SegmentType** type exposes the following members.

■ Constructors

| | Name | Description |
|----|-----------------------------------|--|
| =0 | SegmentType | Constructor por defecto. |
| Ξ₩ | SegmentType(PointType, PointType) | Constructor que toma 2 parámetros: dos puntos. Representan los puntos inicio y final del segmento respectivamente. |

Top

■ Methods

| | Name | Description |
|-----------|-----------------------|---|
| ∃ | CheckRelativePosition | Comprueba si un punto "P" dado, cumple con la condición de posición relativa al segmento establecida por "condition". |
| ≡• | ConvertToLine | Convierte el segmento en un LineType. |
| ≡ | Equals | Determines whether the specified object is equal to the current object. (Inherited from Object.) |

| | Finalize | Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.) |
|------------|-------------------|---|
| ≟ | GetHashCode | Serves as the default hash function. (Inherited from Object.) |
| ∃ © | GetType | Gets the Type of the current instance. (Inherited from Object.) |
| ∃ | isParallelTo | Determina si el segmento es paralelo a otro segmento 'S' dado. |
| ∃ ₩ | isPerpendicularTo | Determina si el segmento es perpendicular a otro segmento 'S' dado. |
| ≅ © | isSecanteTo | Determina si el segmento es secante a otro segmento 'S' dado. |
| Ģ © | MemberwiseClone | Creates a shallow copy of the current Object. (Inherited from Object.) |
| ≅ © | PointInSegment | Determina si el punto 'P' pasado por parámetro pertenece a Segmento. |
| do | PointMayorX | Determina cuál es el punto del segmento que tiene mayor X. |
| ≓♦ | PointMayorY | Determina cuál es el punto del |

| | | segmento que tiene mayor Y. |
|-----------|-------------|---|
| = | PointMenorX | Determina cuál es el punto del segmento que tiene menor X. |
| = | PointMenorY | Determina cuál es el punto del segmento que tiene menor Y. |
| = | ToString | Returns a string that represents the current object. (Inherited from Object.) |

Тор

▲ Fields

| | Name | Description |
|---|------------|---|
| ٠ | EndPoint | Representa el punto de final del segmento. |
| • | StartPoint | Representa el punto de inicio del segmento. |

Тор

■ Properties

| Name | Description |
|--------------|--|
| Angle | Propiedad de solo lectura. Devuelve el ángulo que forma el segmento con respeto al eje de las Abcisas (Eje X). |
| isHorizontal | Propiedad de solo lectura. Devuelve true si el segmento es Horizontal. La caracteristica verticalidad se da si el segmento es paralelo al eje de las Abcisas (Eje X). |
| isObliquo | Propiedad de solo lectura. Devuelve true si el segmento es Obliquo a los ejes de |

| | | coodenadas. Se define el segmento como obliquo si no es paralelo a ninguno de los ejes de coordenadas. |
|----------|------------|---|
| | isVertical | Propiedad de solo lectura. Devuelve true si el segmento es Vertical. La caracteristica verticalidad se da si el segmento es paralelo al eje de las Ordenadas (Eje Y). |
| * | Longitude | Propiedad de solo lectura. Devuelve la longitud del segmento. |
| | MidPoint | Propiedad de solo lectura. Devuelve el punto medio del segmento. |
| | Slope | Propiedad de solo lectura. Devuelve el valor de la pendiente del segmento. Nota: La propiedad devuelve NaN si el segmento es vertical, o sea, si es paralelo al eje de laSs Ordenadas (Eje Y). |

SegmentType isParallelTo Method

Determina si el segmento es paralelo a otro segmento 'S' dado.

Namespace: is2GraphObject

Assembly: is2GraphObj_net4.5 (in is2GraphObj_net4.5.dll) Version:

```
C#
public bool isParallelTo(
SegmentType S
)
```

S

Type: is2GraphObject SegmentType

Segmento contra el que se comprueba la propiedad de paralelismo.

Return Value

Type: Boolean

Devuelve **true** si el segmento que invoca al método es paralelo al segmento "S" dado, en caso contrario devuelve **false**.

▲ See Also

Reference

SegmentType isPerpendicularTo Method

Determina si el segmento es perpendicular a otro segmento 'S' dado.

Namespace: is2GraphObject

Assembly: is2GraphObj_net4.5 (in is2GraphObj_net4.5.dll) Version:

S

Type: is2GraphObject SegmentType

Segmento contra el que se comprueba la propiedad de perpendicularidad.

Return Value

Type: Boolean

Devuelve **true** si el segmento que invoca al método es perpendicular al segmento "S" dado, en caso contrario devuelve **false**.

■ See Also

Reference

SegmentType isSecanteTo Method

Determina si el segmento es secante a otro segmento 'S' dado.

Namespace: is2GraphObject

Assembly: is2GraphObj_net4.5 (in is2GraphObj_net4.5.dll) Version:

```
C#
public bool isSecanteTo(
SegmentType S
)
```

S

Type: is2GraphObject SegmentType

Segmento contra el que se comprueba la propiedad de intersección.

Return Value

Type: Boolean

Devuelve **true** si el segmento que invoca al método es secante al segmento "S" dado, en caso contrario devuelve **false**.

▲ See Also

Reference

SegmentType PointInSegment Method

Determina si el punto 'P' pasado por parámetro pertenece a Segmento.

Namespace: is2GraphObject

Assembly: is2GraphObj net4.5 (in is2GraphObj net4.5.dll) Version:

```
C#
public bool PointInSegment(
    PointType P
)
```

P

Type: is2GraphObject PointType

Punto para el que se quiere comprobar la pertenencia al segmento.

Return Value

Type: Boolean

Devuelve **true** si el punto pertenece al segmento en caso contrario devuelve **false**.

TriangleType Methods

The TriangleType type exposes the following members.

Methods

| | Name | Description |
|-----------|-------------------|---|
| ≡ | Area | |
| ≡ | CircunscriptCicle | |
| =♦ | Equals | Determines whether the specified object is equal to the current object. (Inherited from Object.) |
| <u>~</u> | Finalize | Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.) |
| ≡ | GetAlturas | |
| = | GetBisectrices | |
| ∄© | GetHashCode | Serves as the default hash function. (Inherited from Object.) |
| = | GetMediatrices | |
| =0 | GetSides | |
| = | GetType | Gets the Type of the current instance. |

| | | (Inherited from Object.) |
|------------|-----------------|---|
| ≡ | GetVertex | |
| ≡ | InscriptCicle | |
| ≅ | isPointInside | |
| Ģ ₩ | MemberwiseClone | Creates a shallow copy of the current Object. (Inherited from Object.) |
| ≡ | Perimeter | |
| ≅∳ | ToString | Returns a string that represents the current object. (Inherited from Object.) |
| =0 | TypeByAngle | |
| ≡ | TypeBySide | |
| | | |
